W-CSD Adjustment

1) Timer Stroke Adjustment

1. Calculate the timer stroke from Fig.2 according to the atmospheric temperature at the time of adjustment.
2. Adjust using the timer stroke adjusting screw so that the timer stroke is as calculated in Step 1.

Fig. 1

2) Intermediate Lever Position Adjustment

1. Insert a block gauge (thickness gauge) of 1.9 ± 0.05 mm thickness between the control lever and the idling stopper bolt.
2. Align the intermediate lever with the aligning mark.
3. Adjust the intermediate lever set screw so that the control lever and the intermediate lever set screw are in contact, and then fix in position using the locknut.

3) CSD Lever Adjustment

1. Calculate the block gauge dimension $\ell \pm 0.05\text{mm}$ from Fig. 2 according to the atmospheric temperature at the time of adjustment.
2. Insert the block gauge (thickness gauge) between the control lever and the idling stopper bolt.
3. Using the idling bolt, adjust so that the CSD lever roller and the intermediate lever are in contact.

(Note)

1. The temperature of the wax must be below 30°C when adjusting.
2. When inserting a block gauge (thickness gauge) between the control lever (bracket) and the idling stopper bolt, use the idling adjusting bolt to separate the CSD lever and the intermediate lever so that no excessive force is exerted on them.

Formula for calculating Fig. 2

Formula for calculating timer stroke:

When $-10 \leq t(^{\circ}\text{C}) \leq 20$: $T = -0.055t + 1.1$

When $20 \leq t(^{\circ}\text{C}) \leq 40$: $T = -0.0333t + 0.66$

Formula for calculating control lever and idling stopper bolt gap:

When $-10 \leq t(^{\circ}\text{C}) \leq 20$: $\ell = -0.0867t + 3.63$

When $20 \leq t(^{\circ}\text{C}) \leq 40$: $\ell = -0.075t + 3.4$

LOAD TIMER ADJUSTMENT

1) Adjustment

- ① Fix the control lever in the position satisfying the following conditions.

Boost Pressure : — mmHg

Pump Speed : 190 rpm

Fuel Injection : 17±1 cc/1000st
Quantity

- ② With the control lever positioned as described in ① above, adjust the governor sleeve so that the Timer Stroke conforms to the specified values (page 1 / 6).

■ W-CSD Adjustment

1) Timer Stroke Adjustment (adjust to the thick line)

1. Calculate the timer stroke from Fig. 2 according to the atmospheric temperature at the time of adjustment.
2. Adjust using the timer stroke adjusting screw so that the timer stroke is as calculated in Step 1.

Fig. 1

2) Intermediate Lever Position Adjustment

1. Insert a block gauge (thickness gauge) of 0.25 ± 0.05 mm thickness between the bracket and the idling stopper bolt.
2. Align the intermediate lever with the aligning mark.
3. Adjust the intermediate lever set screw so that the control lever and the intermediate lever set screw are in contact, and then fix in position using the locknut.

3) CSD Lever Adjustment (adjust to the thick line)

1. Calculate the block gauge dimension $\ell \pm 0.05$ mm from Fig. 2 according to the atmospheric temperature at the time of adjustment.
2. Insert the block gauge (thickness gauge) selected in Step (1) above between the bracket and the idling stopper bolt.
4. Using the idling bolt, adjust so that the CSD lever roller and the intermediate lever are in contact.

4) Final Adjustment

After completing the adjustment, screw the timer stroke adjusting screw two turns clockwise. (Move from the temporary adjustment chart to the final adjustment chart.)

※ This W-CSD's timer stroke operations are effective at atmospheric temperatures of 27°C or above.

Therefore, to make adjustment at normal temperatures possible, after adjusting to the substitute characteristics, tighten the timer stroke adjusting screw two turns.

(Note)

1. The temperature of the wax must be below 30°C when adjusting.
2. When inserting a block gauge (thickness gauge) between the control lever (bracket) and the idling stopper bolt, use the idling adjusting bolt to separate the CSD lever and the intermediate lever so that no excessive force is exerted on them.

Formula for calculating Fig. 2

Formula for calculating timer stroke: $T = -0.0367t + 1.424$

Formula for calculating control lever and idling stopper bolt gap: $g = -0.095t + 3.6$

Fig. 2

Starting Injection Quantity Adjustment

Adjust the starting injection quantity (item 1/5) using the adjusting bolt (as shown in the figure at right).

DASH POT ADJUSTMENT

- ① Insert a block gauge (thickness gauge) of thickness 3.8 ± 0.05 mm in the gap between the idling stopper bolt and the bracket.
- ② With the control lever positioned as described in ① above, adjust the dashpot adjusting screw so that the dashpot adjusting screw and the push rod are in contact. Fix the screw using the nut.

- ① Insert a block gauge (thickness gauge) of thickness 7.6 ± 1 in the gap between the control lever and the idling stopper bolt. (control lever angle : $12^\circ \pm 2^\circ$)
- ② With the control lever positioned as described in ① above, adjust the plate position so that the control lever plate and the dash pot push rod are in contact.

■ W-CSD ADJUSTMENT

1) Timer Stroke Adjustment (Refer to Fig 1.2)

- ① Using the graph (Fig 2) , determine the Timer Stroke according to the atmospheric temperature at the time of adjustment.
- ② Adjust using the Timer Stroke adjusting bolt so that the Timer Stroke corresponds to the value determined in note ① above.

2) Fast Idle Adjustment (Refer to Fig 1.2)

- ① Insert a block gauge of 5.3 ± 0.05 mm thickness in the gap between the control lever and the idling stopper bolt.
- ② From Fig 2 determine the dimension of the gap between the idling lever pin and the control lever according to the atmospheric temperature at the time of adjustment.
- ③ Adjust using the fast idle adjusting screw so that the gap corresponds to the value determined in note 2) ② above.
